

Higher Order Derivatives--Cobb Douglas

back to [Fan's Intro Math for Econ](#), [Matlab Examples](#), or [Dynamic Asset Repositories](#)

We have the following general form for the Cobb-Douglas Production Function

$$Y(K, L) = K^\alpha \cdot L^\beta$$

The first order condition is

$$\frac{dY(K, L)}{dL} = (\beta) \cdot K^\alpha \cdot L^{\beta-1}$$

The derivative we have obtained is just another function. We can take additional derivatives with respect to this function.

$$\frac{d^2Y(K, L)}{dL^2} = (\beta) \cdot (\beta - 1) \cdot K^\alpha \cdot L^{\beta-2}$$

Matlab symbolic toolbox gives us the same answer:

```
syms L K0 alpha beta
f(L, K0, alpha) = K0^(alpha)*L^(beta);
frsDeri = diff(f, L)
```

$$\text{frsDeri}(L, K0, \alpha) = K_0^\alpha L^{\beta-1} \beta$$

```
secDeri = diff(diff(f, L), L)
```

$$\text{secDeri}(L, K0, \alpha) = K_0^\alpha L^{\beta-2} \beta (\beta - 1)$$

You can specify an additional parameter for the matlab *diff* function, if we want to take multiple derivatives:

```
syms L K0 alpha beta
f(L, K0, alpha) = K0^(alpha)*L^(beta);
% 5 for 5th derivative
tenthDeri = diff(f, L, 5)
```

$$\text{tenthDeri}(L, K0, \alpha) = K_0^\alpha L^{\beta-5} \beta (\beta - 1) (\beta - 2) (\beta - 3) (\beta - 4)$$

Curvature and Second Derivative, Concave Function

Let's graph out the second derivative when $\beta = 0.5$. The production function is concave (concave down). For a function that is twice continuously differentiable, the function is convex if and only if its second derivative is non-positive (never accelerating).

```
alpha = 0.5;
beta = 0.5;
K0 = 1;
% Note that we have 1 symbolic variable now, the others are numbers
syms L
f(L) = K0^(alpha)*L^(beta);
```

```
% note fDiff1L >= 0 always
fDiff1L = diff(f, L)
```

```
fDiff1L(L) =
```

$$\frac{1}{2\sqrt{L}}$$

```
% note fDiff2L <= 0 always
fDiff2L = diff(f, L, 2)
```

```
fDiff2L(L) =
```

$$-\frac{1}{4L^{3/2}}$$

```
% Start figure
figure();
hold on;
% fplot plots a function with one symbolic variable
fplot(f, [0.2, 3])
fplot(fDiff1L, [0.2, 3])
fplot(fDiff2L, [0.2, 3])
title({'Concave f(x), with K=1, beta=0.5 (decreasing return to scale for L)' 'First and Second Derivatives'})
ylabel({'First derivative is slope=f increase or decrease' '2nd deri is curvature=f increase faster or slower'})
xlabel('Current level of Labor')
legend(['f(x)'], ['First Derivative'], ['Second Derivative'], 'Location', 'SE');
grid on
```

Curvature and Second Derivative, Convex Function

Let's graph out the second derivative when $\beta = 1.2$. The production function is convex (concave up). For a function that is twice continuously differentiable, the function is convex if and only if its second derivative is non-negative (never decelerating).

```

alpha = 0.5;
beta = 1.2;
K0 = 1;
% Note that we have 1 symbolic variable now, the others are numbers
syms L
f(L) = K0^(alpha)*L^(beta);
% Note here fDiff1L >= 0
fDiff1L = diff(f, L)

```

fDiff1L(L) =

$$\frac{6 L^{1/5}}{5}$$

```

% Note here fDiff2L >= 0

```

```

fDiff2L = diff(f, L, 2)

```

fDiff2L(L) =

$$\frac{6}{25 L^{4/5}}$$

```

% Start figure

```

```

figure();

```

```

hold on;

```

```

% fplot plots a function with one symbolic variable

```

```

fplot(f, [0.1, 3])

```

```

fplot(fDiff1L, [0.1, 3])

```

```

fplot(fDiff2L, [0.1, 3])

```

```

title({'Convex f(x), with K=1, beta=1.2 (increasing return to scale for L)' 'First and Second D

```

```

ylabel({'First derivative is slope=f increase or decrease' '2nd deri is curvature=f increase fa

```

```

xlabel('Current level of Labor')

```

```

legend(['f(x)'], ['First Derivative'], ['Second Derivative'], 'Location','NW');

```

```

grid on

```
