6 Old Rules, 5 Still Apply

We had associative, commutative and distributive laws for scalar algebra, we can think of them as the six bullet points below. Only the multiplicative-commutative law no longer works for matrix, the other rules work for matrix as well as scalar algebra.

Associative laws work as in scalar algebra for matrix

- (A + B) + C = A + (B + C)
- $(A \cdot B) \cdot C = A \cdot (B \cdot C)$

Commutative Law works as well for addition

- A + B = B + A
- with scalars, we know $3 \cdot 4 = 4 \cdot 3$, but commutative law for matrix multiplication does not work, Matrix $A \cdot B \neq B \cdot A$. The matrix dimensions might not even match up for multiplication. (see below for examples)

And Distributive Law still applies to matrix

- $A \cdot (B + C) = A \cdot B + A \cdot C$
- $(B+C) \cdot A = B \cdot A + C \cdot A$

Example for $A \cdot B \neq B \cdot A$

B*A

```
% Non-Square
A = rand(2,3)
A = 2 \times 3
   0.6959
              0.6385
                        0.0688
   0.6999
              0.0336
                        0.3196
B = rand(3,4)
B = 3 \times 4
    0.5309
              0.8200
                        0.5313
                                   0.6110
    0.6544
              0.7184
                        0.3251
                                   0.7788
    0.4076
              0.9686
                        0.1056
                                   0.4235
% This is OK
disp(A*B)
    0.8154
              1.0960
                        0.5847
                                   0.9516
    0.5238
              0.9076
                        0.4166
                                   0.5891
% This does not work
try
```

```
disp('does not work! Dimension mismatch')
end
does not work! Dimension mismatch

   0.1745
             0.4322
                        0.7263
```

4 New Rules for Transpose

In scalar algebra, transpose does not make sense. Given matrix A, A^T is the transpose matrix of A where each row of A becomes columns in A^T . If A is M by N, then A^T is N by M.

Given matrix A and scalar value r.

• **1**:
$$(r \cdot A)^T = r \cdot A^T$$

• **2**:
$$(A^T)^T = A$$

catch ME

• **3:**
$$(A+B)^T = A^T + B^T$$

• **4**:
$$(A \cdot B)^T = B^T \cdot A^T$$

For the 4th rule, suppose matrix A is has L rows and M columns, and the matrix B has M rows and N columns. $(A \cdot B)$ is a L by N matrix, $(A \cdot B)^T$ is a N by L matrix. This is equal to $B^T \cdot A^T$, where we have a N by M matrix B^T multiplied by a M by L matrix A^T , and the resulting matrix is N by L.

A = rand(2,3)

 $A = 2 \times 3$
